ABSTRACT

This is the abstract

1 Introduction

2 Proposed method

Consider a convex parametric optimization problem in the standard form:

$$\begin{aligned} \min_{x \in \mathcal{D} \subseteq \mathbb{R}^n} \quad & f(x, \theta) \\ \text{s.t.} \quad & g_i(x, \theta) \leq 0 \quad i = 1, \dots, m \\ & A(\theta)x - b(\theta) = 0 \end{aligned}$$

where $x \in \mathcal{D} \subseteq \mathbb{R}^n$ is the optimization variable; $\theta \in \mathcal{D}_\theta \subseteq \mathbb{R}^k$ are the parameters defining the problem; $f : \mathcal{D}_f \subseteq \mathbb{R}^n \times \mathbb{R}^k \to \mathbb{R}$ is the convex cost function; $g_i : \mathcal{D}_{g_i} \subseteq \mathbb{R}^n \times \mathbb{R}^k \to \mathbb{R}$ are the convex inequality constraints, $A : \mathcal{D}_\theta \to \mathbb{R}^{p \times n}$ and $b : \mathcal{D}_\theta \to \mathbb{R}^p$ defines the affine equality constraints and $\mathcal{D} = \bigcap_{i=1}^m \mathcal{D}_{g_i} \cap \mathcal{D}_f$ is the domain of the optimization problem.

Assume that g_i satisfies Slater's condition. $x^* \in \mathcal{D}$ is optimal if and only if there are λ and ν that, with x^*, satisy the Karush-Kuhn-Tucker conditions (KKT):
